

US009456833B2

(12) **United States Patent**
Maxson et al.

(10) **Patent No.:** **US 9,456,833 B2**
(45) **Date of Patent:** ***Oct. 4, 2016**

(54) **PATIENT-SPECIFIC OSTEOTOMY DEVICES AND METHODS**

(71) Applicant: **Biomet Sports Medicine, LLC**,
Warsaw, IN (US)

(72) Inventors: **William Maxson**, Fort Wayne, IN (US);
Kevin T. Stone, Winona Lake, IN (US);
Andrew L. Pierce, Warsaw, IN (US);
Robert Metzger, Wakarusa, IN (US)

(73) Assignee: **Biomet Sports Medicine, LLC**,
Warsaw, IN (US)

(*) Notice: Subject to any disclaimer, the term of this
patent is extended or adjusted under 35
U.S.C. 154(b) by 0 days.

This patent is subject to a terminal disclaimer.

(21) Appl. No.: **14/159,071**

(22) Filed: **Jan. 20, 2014**

(65) **Prior Publication Data**

US 2014/0135775 A1 May 15, 2014

Related U.S. Application Data

(60) Division of application No. 13/106,295, filed on May
12, 2011, now Pat. No. 8,632,547, which is a
continuation-in-part of application No. 12/714,023,
filed on Feb. 26, 2010, now Pat. No. 8,241,293.

(57) **ABSTRACT**

An osteotomy method includes attaching a patient-specific
osteotomy guide to a corresponding surface of a tibia of a
patient and making an osteotomy at a patient-specific orientation
through a resection slot of the osteotomy guide. The
osteotomy guide is removed and first and second faces of the
osteotomy are opened to form an implant insertion angle. The
first and second faces of the osteotomy are secured at
the implant insertion angle and an osteotomy implant having
a patient-specific wedge angle that is smaller than the
implant insertion angle is implanted. The first and second
faces of the osteotomy are brought to the patient-specific
wedge angle and in contact with the osteotomy implant.

PATIENT-SPECIFIC OSTEOTOMY DEVICES AND METHODS

CROSS-REFERENCE TO RELATED APPLICATIONS

This application is a divisional of U.S. application Ser. No. 13/106,295 filed on May 12, 2011, which is a continuation-in-part of U.S. application Ser. No. 12/714,023 filed on Feb. 26, 2010, now U.S. Pat. No. 8,241,293 issued on Aug. 14, 2012. The disclosures of the above applications are incorporated herein by reference.

INTRODUCTION

Various knee osteotomies are performed to adjust or change the orientation of the tibia to correct various abnormalities caused by birth defects, trauma, or disease. High tibial osteotomies include open-wedge and closed-wedge osteotomies. Various cutting instruments and tools are used to perform such high tibial osteotomies.

The present teachings provide patient-specific osteotomy implants and surgical instruments and associated methods for tibial osteotomies.

SUMMARY

The present teachings provide an osteotomy method and associated implants and instruments. The osteotomy method includes attaching a patient-specific osteotomy guide to a corresponding surface of a tibia of a patient and making an osteotomy at a patient-specific orientation through a resection slot of the osteotomy guide. The osteotomy guide is removed and first and second faces of the osteotomy are opened to form an implant insertion angle. The first and second faces of the osteotomy are secured at the implant insertion angle. An osteotomy implant having a patient-specific wedge angle that is smaller than the implant insertion angle is implanted. The first and second faces of the osteotomy are brought to the patient-specific wedge angle and in contact with the osteotomy implant.

The present teachings also provide an osteotomy surgical kit that includes a patient-specific osteotomy guide and a patient specific osteotomy implant. The osteotomy surgical kit can include a patient-specific spreader, a graduated osteotome and an osteotomy securing device for securing opposite faces of the osteotomy at a predetermined angle for implanting the osteotomy implant. The patient-specific osteotomy guide can include a patient-specific resection slot for guiding the resection and a drill support device for drilling a stress-relief hole at the edge of the osteotomy.

Further areas of applicability of the present teachings will become apparent from the description provided hereinafter. It should be understood that the description and specific examples are intended for purposes of illustration only and are not intended to limit the scope of the present teachings.

BRIEF DESCRIPTION OF THE DRAWINGS

The present teachings will become more fully understood from the detailed description and the accompanying drawings, wherein:

FIG. 1 is a schematic illustration of a cut for open-wedge high tibial osteotomy in relation to the present teachings;

FIG. 1A is a schematic illustration of the geometry of an exemplary cut plane in relation to anatomic sagittal and transverse planes according to the present teachings;

FIG. 2 is a schematic illustration of opening the cut of FIG. 1 to form an wedge opening;

FIG. 3A is an environmental sectional view of a patient-specific wedge for the wedge opening of FIG. 2 according to the present teachings;

FIG. 3B is an environmental sectional view of a patient-specific plate and a patient-specific wedge of open-wedge high tibial osteotomy according to the present teachings;

FIG. 4 is a schematic illustration of removing a bone wedge for closed-wedge high tibial osteotomy in relation to the present teachings;

FIG. 5 is a schematic illustration of closing the wedge opening of FIG. 4 and attaching one fixation plate;

FIG. 5A is a schematic illustration of closing the wedge opening of FIG. 4 and attaching two fixation plates;

FIG. 6 is an environmental view of a patient-specific guide for an open-wedge high tibial osteotomy in relation to the present teachings;

FIG. 7 is an environmental view of a patient-specific guide for closed-wedge high tibial osteotomy in relation to the present teachings;

FIG. 8 is an environmental view of a patient-specific guide for an open-wedge high tibial osteotomy in relation to the present teachings;

FIG. 9 is an environmental view of a patient-specific guide for closed-wedge high tibial osteotomy in relation to the present teachings;

FIG. 10 is an isometric view of a patient-specific guide according to present teachings;

FIG. 11 is an environmental view of the patient-specific guide of FIG. 10 according to present teachings;

FIG. 12 is an isometric view of an exemplary implantable wedge according to present teachings;

FIG. 13 is an environmental view of the patient-specific implantable wedge according to present teachings;

FIGS. 14A and 14B are plan views of exemplary implantable wedges according to present teachings;

FIGS. 15A and 15B are environmental views of a patient-specific resection/drill alignment guide for tibial osteotomy according to the present teachings;

FIG. 16A is a perspective view of an exemplary patient-specific osteotomy implant according to the present teachings;

FIGS. 16B and 16C are perspective views of another patient-specific osteotomy implant according to the present teachings;

FIG. 17 is a perspective view of a patient-specific osteotomy spreader according to the present teachings;

FIG. 18 is a perspective view of an impactor assembly according to the present teachings;

FIG. 19A is an environmental perspective view illustrating opening an osteotomy with a patient-specific osteotomy spreader according to the present teachings;

FIG. 19B is an environmental perspective view illustrating further opening the osteotomy of FIG. 19A with a graduated osteotome according to the present teachings;

FIG. 20 is a perspective view of an osteotomy securing device according to the present teachings;

FIG. 21 is a perspective view of an osteotome according to the present teachings;

FIG. 22 is an environmental view of the osteotomy securing device of FIG. 20 shown with a spreader and an osteotome inserted in the osteotomy;

FIG. 23 is an environmental view of the osteotomy securing device of FIG. 20 holding the osteotomy open;

FIG. 24 is an environmental view of a patient-specific osteotomy implant and fixation plate;

FIG. 25 is a perspective view of a posterior blade guard according to the present teachings; and

FIG. 26 is an auxiliary osteotome according to the present teachings.

Corresponding reference numerals indicate corresponding parts throughout the several views of the drawings.

DETAILED DESCRIPTION

The following description is merely exemplary in nature and is in no way intended to limit the present teachings, applications, or uses. For example, although the present teachings are illustrated for patient-specific instruments and implants for high tibial osteotomy, the present teachings can be used for other types of osteotomy procedures.

The present teachings generally provide patient-specific osteotomy surgical kits that include alignment guides and associated implant components for use in osteotomy, such as high tibial osteotomy, for example. The patient-specific alignment guides can be used either with conventional or patient-specific implant components prepared with computer-assisted image methods. Computer modeling for obtaining three dimensional images of the patient's anatomy using MRI or CT scans of the patient's anatomy, the patient specific prosthesis components, and the patient-specific guides and templates can be provided by various CAD programs and/or software available, for example, by Materialise USA, Plymouth, Mich.

The patient-specific alignment guides and associated patient-specific implants disclosed herein can be generally formed using computer modeling based on the patient's 3-D anatomic image generated from image scans. The patient-specific alignment guides can have a three-dimensional engagement surface that is made to conformingly contact and match a three-dimensional image of the patient's bone surface (selectively with or without soft tissue), by the computer methods discussed above. The patient-specific alignment guides can include custom-made guiding formations, such as, for example, guiding bores or cannulated guiding posts or cannulated guiding extensions or receptacles that can be used for supporting or guiding other instruments, such as drill guides, reamers, cutters, cutting guides and cutting blocks or for inserting pins or other fasteners according to a surgeon-approved pre-operative plan.

In various embodiments, the patient-specific alignment guide can include one or more patient-specific cutting guides for receiving and guiding a cutting blade at corresponding patient-specific cutting plane orientations relative to a selected anatomic axis for the specific patient. The patient-specific alignment guides can also include guiding formations for guiding the implantation of patient-specific or off-the-shelf implants associated with the osteotomy procedure, such as implantable wedges and implantable fixation plates. The geometry, shape and orientation of the various features of the patient-specific alignment guide, as well as various patient-specific implants and other patient-specific tools can be determined during the pre-operative planning stage of the procedure in connection with the computer-assisted modeling of the patient's anatomy. During the pre-operative planning stage, patient-specific alignment guides, implants and other tools, can be designed and manufactured for a specific patient with input from a surgeon or other professional associated with the surgical procedure, as described in the commonly assigned and co-pending patent applications listed in the cross reference section and incorporated herein by reference.

In the following discussion, the terms "patient-specific", "custom-made" or "customized" are defined to apply to components, including tools, implants, portions or combinations thereof, which include certain geometric features, including surfaces, curves, or other lines, and which are made to closely conform as mirror-images or negatives of corresponding geometric features of a patient's anatomy during a pre-operative planning stage based on 3-D computer images of the corresponding anatomy reconstructed from image scans of the patient by computer imaging methods. Further, patient-specific guiding features, such as, guiding apertures and guiding slots, or other holes or openings that are included in alignment guides or in implants are defined as features that are made to have positions, orientations, dimensions, shapes and and/or define cutting planes specific to the particular patient's anatomy based on the computer-assisted pre-operative plan associated with the patient.

A patient-specific osteotomy kit for an open-wedge osteotomy can include, according to the present teachings, a patient-specific alignment guide 200, as shown in FIG. 6, for example, a patient-specific implantable wedge (or wedge implant) 300, as shown in FIGS. 3A-3B, for example, and a patient-specific implantable fixation plate 400, as shown in FIG. 5, for example. The implantable wedge 300 and a patient-specific implantable fixation plate 400 can be modularly connected, or alternatively formed monolithically as a single integral structure. An off-the-shelf, i.e. non patient-specific implantable wedge or an off-the-shelf, i.e. non patient-specific implantable fixation plate can also be used optionally with the patient-specific alignment guide 200. For closed-wedge osteotomies, the implantable wedge 300 is omitted. It will be appreciated that the patient-specific alignment guides for open-wedge and closed-wedge osteotomies can include different features, as discussed below.

The patient-specific osteotomy kit can also include custom-made saw blades 500a, 500b having a predetermined cutting length corresponding to a patient-specific cutting depth. The cutting depth can be determined at the pre-operative planning stage. In various embodiments, the predetermined cutting length can be an actual dimension of the cutting edge of the blade 500b (see FIG. 9). In various other embodiments, the cutting depth can be adjustable and the blade 500a can include markings 502 indicating a patient-specific cutting depth (see FIG. 6). The cutting depth can also be constrained by a depth stop engaging the patient-specific alignment guide 200 at a patient-specific depth and preventing insertion of the cutting blade beyond the predetermined length. A separate, commercially available depth gauge can also be used to mark and restrict cutting to a pre-determined patient-specific cutting depth.

Referring to FIGS. 1 and 2, an exemplary open-wedge high tibial osteotomy is illustrated in association with a knee joint 75 between a femur 70 and a tibia 80. A planar cut 90 at a selected angle β relative to a first reference axis A of the knee joint 75 can be made using the patient-specific kit of the present teachings. The first reference axis A can be a selected anatomic axis, such as, for example a mechanical axis of the joint or leg, a mechanical axis of the femoral bone, or a mechanical axis of the tibial bone, when different from the mechanical axis of the leg. Other anatomic axes, such as axes having significantly different orientations than the orientation of axis A illustrated in FIG. 1, can be used as reference axes, including, for example, an epicondylar axis, which can be substantially transverse to the axis A of FIG. 1. The angle β of the planar cut 90 relative to the reference

axis A can be determined during the pre-operative planning stage of the osteotomy and in relation to the corresponding alignment guide **200**.

The planar cut **90** can also be oriented at a patient-specific angle relative to second and third reference axes B_1 and B_2 . A representative geometry illustrating the orientation of an exemplary cut plane P in relation to a sagittal plane S and a transverse plane T of the patient's anatomy is shown in FIG. 1A. In FIG. 1A, a first angle ϕ_1 is defined between an axis N perpendicular to the cut plane P and an axis Z parallel to the first reference axis A, which extend superiorly-inferiorly on the sagittal plane. The first angle ϕ_1 and angle β have a sum of 90 degrees. A second angle ϕ_2 is defined between the axis N and an axis X parallel to the second reference axis B_1 , which extends medially-laterally on the transverse plane T. A third angle ϕ_3 is defined between the axis N and an axis Y parallel to the third reference axis B_2 , which extends anteriorly-posteriorly on the transverse plane T. Medial-lateral, anterior-posterior and superior-inferior orientations of the cut plane P can be specified by selecting patient-specific values for these angles, keeping in mind that only two of the three angles can be specified independently, while the third can be calculated from the relation that the sum of the squares of the cosines of the angles is equal to 1. In the following discussion, although patient-specific orientations of planar cuts and corresponding planar slots relative to the axis A will be described in detail, it will be understood that the planar cuts and planar slots can be additionally or alternatively be oriented at patient-specific angles about the axes B_1 and B_2 .

Referring to FIGS. 1-3, the planar cut **90** is a partial cut, i.e., not a through cut, and can extend from a first boundary **92** at the intersection of the planar cut **90** with the outer surface of the tibia **80** to a second boundary **94** at the selected patient-specific cutting depth illustrated as distance L in FIG. 1. The first boundary **92** can be generally a curved line reflecting the curvature of the outer surface of the tibia **80**. The second boundary **94** can be substantially a straight line as formed by the saw blade. The second boundary **94** can function as a hinge line (also referenced with numeral **94**) for opening a wedge or osteotomy angle γ between first and second opposing faces **96**, **98** of the cut **90**, as illustrated by arrows C in FIG. 2. The osteotomy angle γ is patient-specific and can be selected during the pre-operative planning stage. The location of the first and second boundaries **92**, **94**, the angle β of the planar cut **90** relative to the reference axis A and the wedge angle γ can be determined during the pre-operative planning stage for correcting a condition of the particular patient, including conditions resulting from idiopathic bone misalignment, joint or bone disease, trauma, cancer or other therapeutic or corrective surgery. Similarly, the planar cut **90** can be oriented at a corresponding patient-specific angle ϕ_2 relative to the medial-lateral axis B_1 , as illustrated in FIG. 1A.

Referring to FIGS. 1-3A, a patient-specific implantable wedge **300** having a corresponding wedge angle γ defined between first and second planar surfaces **302**, **304** can be inserted and/or pushed between the first and second faces **96**, **98** of the cut **90**, while the cut **90** is partially open, i.e., while the first and second faces **96**, **98** form an angle smaller than the angle γ , for guiding and facilitating the correct wedge opening to form the pre-selected angle γ . It will be appreciated, however, the cut **90** can be opened to an angle γ , using any other tool, such as trial wedge having the same angle γ . In some embodiments, the cut **90** is opened at an angle greater than γ , as discussed below in connection with FIGS. 20-23.

With continued reference to FIGS. 1-3A, the first and second planar surfaces **302**, **304** of the implantable wedge **300** can meet at a straight edge or truncated plane surface **306**. Upon insertion of the implantable wedge **300**, the cut **90** is opened and secured to the selected angle γ by the implantable wedge **300**. The first and second planar surfaces **302**, **304** of the implantable wedge **300** can abut against the first and second faces **96**, **98** of the planar cut **90**, and the edge **306** of the implantable wedge **300** can abut the second boundary **94** of the planar cut **90**. The implantable wedge **300** can have a patient-specific boundary surface **308** opposite to the edge/surface **306**. The boundary surface **308** is designed during the pre-operative planning stage as a continuous and smooth surface that provides a continuous contour relative to the contour of the tibia **80** on either side of the cut **90**. The implantable wedge **300** can also be secured directly in the bone with sutures, pins, anchors or other fasteners. In some embodiments, the implantable wedge can be cemented or coated with materials promoting bone in-growth.

Alternatively, and referring to FIGS. 3A and 3B, a patient-specific implantable fixation plate **400** can be used in combination with the patient-specific implantable wedge **300**. The patient-specific implantable wedge **300** and the patient-specific fixation plate **400** can be modularly connected, as illustrated in FIG. 3B, or can be provided as a single monolithic and integrally formed component. A modular connection can include a dovetail connection illustrated at reference numerals **402** and **310** corresponding to opposing connection formations of the fixation plate **400** and implantable wedge **300**. Other connection formations can include a taper lock connection, various groove and tongue connections, or connections with threadable fasteners or other biocompatible fasteners. The modular connection can be formed at a common boundary **404** between the fixation plate **400** and the implantable wedge **300**.

The fixation plate **400** can include patient-specific surfaces **406a**, **406b** on either side the implantable wedge **300** and can be anchored to the tibia **80** using bone pins or other bone fasteners **450** that pass through corresponding apertures **408** of the fixation plate **400**. The location and orientation of the apertures can also be patient-specific and determined during the pre-operative planning stage for the particular patient.

In various embodiments, and referring to FIG. 6, a patient-specific alignment guide **200** for an open-wedge osteotomy is illustrated. The alignment guide **200** can include a three-dimensional patient-specific engagement surface **202** made to conform to a corresponding outer surface of the tibia **80** by a computer-assisted method utilizing a 3-D image of the patient's tibia **80** during the pre-operative planning stage, as discussed above. The alignment guide **200** can include one or more guiding receptacles, the precise location of which is determined on the basis of a pre-operative surgical plan for locating alignment pins or other fasteners or for assisting in locating cutting blades or other cutting instruments for resecting the bone and/or shaping the bone for receiving an implant, as described in commonly-owned, co-pending in U.S. patent application Ser. No. 11/756,057, filed on May 31, 2007, incorporated herein by reference. The alignment guide can be placed on and conform with the anterior/lateral surface of the tibia, for example.

Referring to FIG. 6, the alignment guide **200** can include a guiding receptacle in the form of a planar slot **206** oriented to define a patient-specific angle β relative to the anatomic axis A for guiding a blade **500a** to form the planar cut **90**.

The blade **500a** can include depth-control indicia **502** corresponding to the hinge line **94**. The alignment guide **200** can also define one or more fixation apertures **204** for receiving bone fixation fasteners **250**. Additional guiding receptacles, such as guiding apertures **208**, can be provided for preparing fastener holes in the tibia **80** to receive the bone fixation fasteners **250** through the apertures **408** of the fixation plate **400**. The location and orientation of the planar slot **206**, the apertures **204** for the fasteners **250** and the guiding apertures **208** relative to alignment guide **200** can be determined during the pre-operative planning stage on a patient-specific (patient customized) basis. Similarly, the planar slot **206** can be oriented at a corresponding patient-specific angle ϕ_2 relative to the medial-lateral axis B_1 , as illustrated in FIG. 1A.

Referring to FIG. 8, another alignment guide **200** for open-wedge osteotomy is illustrated. The alignment guide **200** can be placed on the anterior and/or lateral side of the proximal tibia **80**, such that the three-dimensional patient-specific engagement surface **202** of the alignment guide **200** closely conforms to the corresponding portion of the tibia **80**. The plane defined by the planar slot **206** is shown in phantom at a corresponding angle $\beta=90-\phi_1$ relative to the reference/anatomic axis A , as discussed above in connection with FIG. 6. A blade **500b** can be used for the plane cut through the planar slot **206** having a size that provides automatic control of the length of the cut.

Referring to FIGS. 4 and 5, an exemplary closed-wedge high tibial osteotomy is illustrated in association with a knee joint **75** between a femur **70** and a tibia **80**. First and second partial planar cuts **90a**, **90b** at corresponding selected first and second angles β_1 and β_2 relative to a reference/anatomic axis A of the knee joint **75** can be made using a patient-specific kit of the present teachings. The first and second planar cuts **90a**, **90b** can intersect at a hinge line **94**. The first and second angles β_1 and β_2 of the planar cuts **90a**, **90b** relative to the reference axis A can be determined during the pre-operative planning stage of the osteotomy and in relation to the corresponding alignment guide **200**. Each of the first and second angles β_1 and β_2 is complementary of a corresponding angle ϕ_1 shown in FIG. 1A ($90-\beta_1$ and $90-\beta_2$). Similarly, the first and second cuts **90a**, **90b** can be oriented at corresponding and different angles ϕ_2 relative to the medial-lateral axis B_1 , as illustrated in FIG. 1A. The first and second angles β_1 and β_2 of the planar cuts **90a**, **90b** define a bone wedge **91** of predetermined wedge angle $\gamma=\beta_1-\beta_2$. The bone wedge **91** can be removed and the corresponding wedge opening can be closed by bringing the surfaces of the first and second cuts **90a**, **90b** in contact by rotating about the hinge line **94**. A first (or osteotomy-side) patient-specific fixation plate **400'** can be attached to the tibia **80** to secure the first and second cuts **90a**, **90b** in contact after the bone wedge **91** is removed. The first and second cuts **90a**, **90b** can also be secured by pins, sutures or other fasteners to the bone. In the fixation plate **400'** the same reference numerals are used to indicate features having the same functions as in the fixation plate **400**. The fixation plate **400'** can include a patient-specific engagement surface **406** and apertures **408** at patient-specific positions and orientations for guiding bone fixation fasteners **250** through the apertures **408** and into the tibia **80**.

Referring to FIGS. 5 and 5A, a second (or hinge-side) fixation plate **400'a** can be used opposite the first or osteotomy-side fixation plate **400'** on the side of the osteotomy hinge. The second fixation plate **400'a** can be a patient-specific fixation plate or an off-the shelf commercially available fixation plate. The second plate **400'a** can be

attached to the tibia with separate fasteners. Alternatively, the same fixation fasteners **250** can extend between both the first and second plates **400'** and **400'a**. In such case, the guiding apertures **208** of the alignment guide **200'** can be used to drill guiding holes through the entire width of the tibia **80** for guiding the location of the first and second plates **400'** and **400'a** and the common fixation fasteners **250** through the tibia and through the first and second plates **400'** and **400'a**.

Referring to FIG. 7, a patient-specific alignment guide **200'** for a closed-wedge osteotomy is illustrated. In alignment guide **200'** the same reference numerals are used to indicate features having the same functions as in alignment guide **200**. The alignment guide **200'** can include a three-dimensional patient-specific engagement surface **202** made to conform to a corresponding outer surface of the tibia **80** by a computer-assisted method utilizing a 3-D image of the patient's tibia **80** during the pre-operative planning stage, as discussed above. The alignment guide **200'** can define first and second guiding receptacles in the form of first and second planar slots **206a**, **206b** oriented at selected first and second angles β_1 and β_2 relative to a reference/anatomic axis A for guiding a blade to form the planar cuts **90a**, **90b** of the removable bone wedge **91**. The alignment guide **200'** can also define one or more apertures **204** receiving bone fixation fasteners **250**. Additional guiding receptacles, such as guiding apertures **208** can be provided for drilling or otherwise preparing fastener holes in the tibia **80** corresponding to the apertures **408** of the fixation plate **400** for securing the fixation plate **400** to the tibia **80**. The location and orientation of the first and second planar slots **206a**, **206b**, the apertures **204** and the guiding apertures **208** relative to alignment guide **200'** can be determined during the pre-operative planning stage on a patient-specific base. The alignment guide **200'** can be used with a blade **500a** having depth indicia **502**.

Referring to FIG. 9, another alignment guide **200'** for closed-wedge osteotomy is illustrated. The alignment guide **200'** can be placed on the anterior and/or lateral side of the proximal tibia **80**, such that the patient-specific engagement surface **202** of the alignment guide **200'** closely conforms to the corresponding portion of the tibia **80**. The planes defined by the first and second planar slots **206a**, **206b** are shown in phantom at corresponding first and second angles β_1 and β_2 (not shown) relative to the reference/anatomic axis A , as discussed above in connection with FIG. 7 and FIG. 1A. Additionally and optionally, each of the first and second angles β_1 and β_2 is complementary of a corresponding angle ϕ_1 shown in FIG. 1A ($90-\beta_1$ and $90-\beta_2$). Similarly, the planes defined by the first and second planar slots **206a**, **206b** can be oriented at corresponding and different angles ϕ_2 relative to the medial-lateral axis B_1 , as illustrated in FIG. 1A.

Referring to FIGS. 10-13, another embodiment of a patient-specific alignment guide is illustrated at **600**. As in the embodiments discussed above, the patient-specific alignment guide includes a three-dimensional patient-specific engagement surface **602**, fixation apertures **604** for bone fixation fasteners **650** and guiding apertures **608** for drilling holes in the bone. In this embodiment, the alignment guide **600** includes a central cylindrical through-hole **611** passing through the center of a planar slot **606**. The central hole **611**, which has a diameter greater than the opening of the slot **606**, can facilitate cutting with a blade along the slot **606** through either side of the central hole **611**. Referring to FIG. 11, the central hole **611** of the alignment guide **600** can be used to drill a hole **93** in the bone **80** before the planar

osteotomy cut **90** is performed at a selected patient-specific angle β , as shown in FIG. **11**. The patient-specific guide **600** can include radiopaque markers **620**, which are visible in radiographic images and can provide directional guidance during the surgical procedure. Similar markers in the form of lines or points/spots can also be provided on the patient-specific alignment guides **200**, **200'** discussed above.

Referring to FIGS. **12** and **13**, a patient-specific implantable wedge **700** can be inserted through the osteotomy cut to keep the osteotomy open. Similarly to the embodiments described above, the implantable wedge **700** can include a three-dimensional patient-specific surface **708** (best shown in FIG. **13**), an elongated curved central portion **712** conforming to shape of the drilled hole **93** on the opposite surfaces of the planar cut **90**. The elongated central portion **712** can be cylindrical or tapered (truncated cone or conical segment). A pair of planar portions **702**, **704** extends radially from opposite sides of the central portion **712** from the patient specific surface **708** to an end surface **706** and defines a wedge of angle γ . The central portion **712** can be aligned with the hole **93** and provide a guide for centering and inserting the implantable wedge **700** into the osteotomy cut **90**. The central portion **712** can have greater thickness than and protrude away from and outside the planar portions **702**, **704**.

The various patient-specific implantable wedges **300**, **700** for the open-wedge osteotomy can be made of various biocompatible materials including, for example, various solid metals or alloys, solid PEEK, porous metal and porous metal alloys, porous thermoplastics, such as PEEK (polyether ether ketone), PEKK (polyether ketone ketone), osteoinductive or osteoconductive materials, including Pro Osteon®, commercially available from Biomet, Inc., Warsaw, Ind., with or without a resorbable filler material, and/or combinations thereof. The implantable wedges **300**, **700** can also be in the form of multiple-component wedges with or without interlocking connecting features. An exemplary illustration of a multiple-piece implantable wedge **800** is shown in FIGS. **14A** and **14B**. The implantable wedge **800** can extend from a first surface **808** to a second surface **807**. The first surface **808** can be optionally patient-specific. The implantable wedge **800** can include a plurality of separate components **802**. Two adjacent components **802** can be in contact at a common boundary **804**. The adjacent components **802** can also be optionally interlocked with a connecting feature **806**. The connecting feature **806** can be a single structural connector or a plurality of structural connectors, including tongue and groove, interdigitation, dovetail, threaded fasteners, etc.

The various fixation plates **400**, **400'**, **400'a** can be made of similar materials. For open-wedge osteotomies, the fixation plate **400** can be integral to the implantable wedge **300**, modularly coupled to the implantable wedge **300** via a connecting joint or fasteners, or directly coupled to the bone outside the implantable wedge **300**. The various alignment guides **200**, **200'**, **600** can be made of any biocompatible material, including, polymer, ceramic, metal or combinations thereof.

As discussed above in connection with FIGS. **1-14B**, a surgical kit for an open-wedge or a closed-wedge high tibial osteotomy can be provided on a patient-specific basis. The surgical kit can include a patient-specific alignment guide and, optionally, a patient-specific or an off-the-self fixation plate. For an open-wedge osteotomy, the surgical kit can include a patient-specific or an off-the-shelf implantable wedge. The patient-specific tools and implants are customized and prepared for the specific patient during a computer-

assisted pre-operative planning stage in which the patient's anatomy is modeled in three dimensions from two-dimensional image scans. Patient-specific or customized blades can be included to provide adjustable depth control or automatic length. Other, non-customized blades can also be included.

Additional embodiments of patient-specific implants and instruments for performing open osteotomy are illustrated in FIGS. **15A-24**. The instruments include a patient-specific resection/drill alignment guide (or osteotomy guide, for short) **900**, a drill guide **920** (FIGS. **15A** and **15B**), patient-specific osteotomy implants **1000** and **1000A** (FIGS. **16A-16C**), a patient-specific osteotomy spreader **1100** (FIG. **17**), a graduated osteotome **1100A** (FIG. **21**), an impactor assembly **1200** (FIG. **18**), an osteotomy securing device **1300** (FIG. **20**) and a fixation plate **1500** (FIG. **24**). These instruments and implants can also be used to supplement and/or replace corresponding instruments and implants discussed above in connection with FIGS. **1-14B** and can also be included in the surgical kit described above for a particular patient and surgeon as optional additional or interchangeable components.

Generally, medical scans of the patient's anatomy, including the proximal femur and tibia, are imported into a computer program, such as the software commercially available from Materialise USA, as discussed above. A virtual three-dimensional model of the patient's anatomy is reconstructed using the software. A surgeon's planned osteotomy, including osteotomy angle correction and extent can be virtually modeled and patient-specific guides and other instruments can be designed based on the virtual model. More specifically, the osteotomy guide **900** shown in FIGS. **15A** and **15B**, the osteotomy implants **1000** and **1000A** shown in FIGS. **16A-16C** and the osteotomy spreader **1100** shown in FIG. **17** can all be patient-specific and designed from the medical scans of the patient. The fixation plate **1500** can also be patient-specific, although a non-custom fixation plate can also be used. Before describing in further detail the various instruments and implants referenced above in connection with FIGS. **15A** to **24**, an exemplary procedure using these instruments and implants is described below.

Referring to FIG. **15A**, the osteotomy guide **900** is mounted or nested in a unique (only one) position on a surface **82** of the tibia **80** according to the preoperative plan for the patient for performing an osteotomy to correct the patient's joint misalignment or other defect. Referring to FIG. **19A**, a patient-specific osteotomy spreader **1100** is driven into the osteotomy **90** that has been previously cut using the osteotomy guide **900**. The osteotomy **90** can be optionally opened further to allow for the insertion of the osteotomy implant **1000** or **1000A** using the graduated osteotome **1100A** of FIG. **21**. The osteotomy securing device **1300** can be affixed across the osteotomy **90** to keep the osteotomy **90** open. The osteotomy spreader **1100** and the graduated osteotome **1100A**, if used, can then be removed, as shown in FIGS. **22** and **23**. The patient-specific osteotomy implant **1000** (or **1000A**) can be implanted into the opened osteotomy **90** and a fixation plate **1500** can be affixed over the osteotomy **90** and the osteotomy implant **1000** (**1000A**), as shown in FIG. **24**. These implants, instruments and procedures are described in further detail below.

Referring to FIGS. **15A** and **15B**, the osteotomy guide **900** includes an alignment portion **902**, a resection (and drill) portion **908** for guiding a resection and drilling a hole through the alignment portion **902**, a drill support **914** and a drill guide **920**. The alignment portion **902**, the resection

portion **908** and the drill support **914** can be made as a one-piece integral (monolithic) unit. The drill guide **920** can be removably coupled to the drill support **914**, as discussed below. The alignment portion **902** includes a patient-specific three-dimensional inner surface **904** that is designed and configured during the preoperative plan to be complementary and nestingly mate with a corresponding outer surface **82** (including patient-specific natural bone landmarks thereon, such as osteophytes, for example) of the patient's tibia **80** only in one position. The alignment portion **902** can also include two or more guiding formations **906** having through bores **907** for attaching the osteotomy guide **900** to the tibia **80** using K-wires, pins or other bone fasteners. Two guiding formations **906** are illustrated in FIG. **15A**.

With continued reference to FIG. **15A**, the resection portion **908** can include a resection slot **910** for guiding a cutting tool to perform the osteotomy **90** according to the preoperative plan for the patient. The resection slot **910** passes through the alignment portion **902** and is sized and oriented relative to the alignment portion **902** (and therefore relative to the tibia **80**) according to preoperative patient-specific, surgeon-approved, selected anatomic considerations, and other considerations. In some embodiments, the resection portion **908** can include a unicortical or a longer bicortical **912** intersecting the resection slot **910** and configured for guiding the insertion of the osteotomy implants **1000**, **1000A**, as discussed below and drilled before initiating the resection procedure through the resection slot **910**. A unicortical hole **912** is a blind hole that stops short of penetrating the cortical bone on the opposite side of the resection, while a bicortical hole **912** is a through hole, i.e., a hole long enough to penetrate the opposite side of the cortical bone. The drill hole **912** is illustrated in FIG. **15A**. A corresponding pre-resection guiding bone hole, such as the bone hole **93** described above in the embodiments related to FIG. **11**, is drilled through the drill hole **912** into the tibia **80** for guiding the implant.

With continued reference to FIG. **15A**, the drill support **914** can include a curved rig or frame or other three-dimensional structure **913** extending from the alignment portion **902** having a guiding tube **916** with a through bore **918**. The drill support **914** is sized and shaped such that the through bore **918** can orient the drill guide **920** to drill a stress-relief hole **95** at the sharp edge (end) of the osteotomy **90**, as shown in FIG. **19A**. The drill guide **920** can include a tubular shaft **923** that is removably inserted through the guide tube **916** and has a longitudinal opening **924** for stabilizing and guiding a drill bit to drill the stress-relief hole **95** along the edge of the osteotomy **90**. The stress-relief hole **95** reduces crack initiation by rounding the sharp edge of the osteotomy **90** and reducing stress concentration. The drill guide **900** can also include a handle **922** for holding and stabilizing the drill guide **920** during use.

In some embodiments, before performing the osteotomy **90** through the resection slot **910** and before drilling the guiding hole **93** through the drill hole **912** of the osteotomy guide **900**, a posterior blade guard **1600**, shown in FIG. **25**, can be used to protect nerve bundles and/or other soft tissue in the posterior surface of the knee. The posterior blade guard **1600** has a thin, three-dimensionally ribbon-like body that includes a flat (substantially planar) distal portion **1602**, a curved U-shape portion **1604**, and a flat proximal portion **1606** from which a connector shaft **1610** extends. Intraoperatively, the distal portion **1602** is inserted against the posterior surface of the tibia **80** and functions as a blade stop to protect posterior nerve bundles, ligaments and other tissue from being inadvertently damaged during the osteotomy.

The middle portion **1604** functions as a retractor of soft tissue about the incision for the procedure. The shaft **1610** can have an end portion **1614** configured for coupling with an osteotomy handle, such as, for example, the tip **1210** of the impactor assembly **1200**. After resection using the osteotomy guide **900**, an auxiliary osteotome **1650**, shown in FIG. **26**, can be used to finish the osteotomy **90**, if not fully completed. The auxiliary osteotome **1650** includes a handle or shaft **1652** carrying a distal blade **1654** with a sharp distal edge **1656** and a proximal impactor surface **1658**. The posterior blade guard **1600** and the auxiliary osteotome **1650** can also be included in the osteotomy kit.

Referring to FIGS. **16A-16C**, exemplary embodiments of an osteotomy implant **1000** and **1000A** are illustrated. The osteotomy implant **1000** is configured for a procedure using a unicortical drill hole **912** and includes a corresponding curved hump or protrusion or curved ridge **1014**, as shown in FIGS. **16B** and **16C**. The curved ridge **1014** is configured to be received into the osteotomy hole **93** drilled through the drill hole **912** of the osteotomy guide of FIG. **15A**. The osteotomy implant **1000A** is configured for a procedure using a deeper, bicortical hole **912** and includes two corresponding protrusions or curved ridges **1014a**, **1014b**, as shown in FIG. **16A**. The curved ridge **1014** or ridges **1014a**, **1014b** can help align and direct the osteotomy implant **1000** (**1000A**) into the bone along an insertion axis coinciding with the longitudinal axis of the curved ridge **1014** (or common longitudinal axes of curved ridges **1014a**, **1014b**). In the osteotomy implant **1000A**, the insertion orientation is along an anterior-posterior orientation. Other orientations for inserting the osteotomy implant **1000** can also be selected by changing the location and orientation of the curved ridge **1014**, such as, for example, along a medial to lateral direction or from an anterior-medial position toward a posterior-media position, as illustrated by the different orientations of the curved ridge **1014** in FIGS. **16B** and **16C**. In other respects, the osteotomy implants **1000**, **1000A** are similar and same reference numbers are used to describe similar or common to features. The osteotomy implant **1000** or **1000A** is wedge-shaped and also U-shaped or horseshoe-shaped. Specifically, the osteotomy implant **1000** (**1000A**) includes first and second surfaces **1002**, **1004** forming a wedge with wedge angle equal to a patient-specific osteotomy angle γ designed to be received in the osteotomy **90** to correct the patient's joint misalignment, as determined during the preoperative plan.

The osteotomy implant **1000** (**1000A**) can have a horseshoe shape or a U shape or other open-channel shape that is formed by a peripheral surface between the first and second surfaces **1002**, **1004** of the osteotomy implant **1000** (**1000A**). The peripheral surface includes an outer wall surface **1008**, an inner wall surface **1006** and first and second end surfaces **1010**, **1012**. The inner wall surface **1006** defines an opening for allowing access to a stem or other component of a tibial implant, if a tibial implant is to be implanted at some later time. The outer wall surface **1008** is configured during the preoperative plan to match and be continuous with the outer surface of the tibia of the patient adjacent to the osteotomy **90**. The first and second end surfaces **1010**, **1012** are generally rounded or not sharp and are designed to end before the stress-relief hole **95**.

As discussed above in connection with osteotomy implants **400**, **700**, the osteotomy implants **1000**, **100** can be made of various biocompatible materials including, for example, various solid metals or alloys, solid PEEK, porous metal and porous metal alloys, porous thermoplastics, such as PEEK (polyether ether ketone), PEKK (polyether ketone)

13

ketone), osteoinductive or osteoconductive materials, including Pro Osteon®, commercially available from Biomet, Inc., Warsaw, Ind., with or without a resorbable filler material, and/or combinations thereof. In some embodiments, two or more different materials can be used in each implant **1000** (**1000A**). For example, the central curved portion of the implant **1000** (**100A**) can be made of a porous material (porous metal, porous PEEK or PEKK), while portions around and including the protrusions **1014**, or **1014a**, **1014b**, as well as portions adjacent and including first and second end surfaces **10110**, **1012** can be made of a solid material (solid metal, solid PEEK or PEKK).

Referring to FIGS. 17, 18, 19A, 19B and 21, after the osteotomy **90** is cut into the tibia **80** using the osteotomy guide **900** of FIG. 15A, the patient-specific osteotomy spreader **1100** can be used to open up the osteotomy **90** in preparation for receiving an osteotomy implant **1000** (**1000A**). The osteotomy spreader **1100** is wedge-shaped. The wedge is defined by first and second opposing surfaces **1102**, **1104** intersecting at a sharp edge **1108** and forming an angle equal to the patient-specific angle γ of the osteotomy implant **1000** (**1000A**). The osteotomy spreader **1100** includes a peripheral surface **1106** which can also be designed during the preoperative plan to be patient-specific. The osteotomy spreader **1100** can also be used as a trial for the osteotomy implant **1000** (**1000A**). The osteotomy spreader **1100** can include a short tubular shaft **1110** with internal threads **1112** for connecting to an externally threaded tip **1210** of the impactor assembly **1200**, shown in FIG. 18. In some embodiments, the external and internal threads in the osteotomy spreader **1100** and the threaded tip **1210** may be reversed. In other embodiments, the osteotomy spreader **1100** and the impactor assembly can be coupled by other connecting means, such as bayonet coupling, taper to taper connection, or other quick connect/disconnect couplings.

The impactor assembly **1200** includes an impactor plate **1204** having an impactor surface **1206**, a handle **1202** coupled to the impactor plate **1204**, and a shaft **1208** extending from the handle **1202** and terminating at the externally threaded tip **1210**. The impactor assembly **1200** can be coupled to the osteotomy spreader **1100**, which is then pushed against the osteotomy **90**. Striking the impactor surface **1206** with a mallet opens the osteotomy **90**, as shown in FIG. 19A. When the osteotomy spreader **1100** is fully driven into the osteotomy **90**, the opposite faces **96**, **98** of the osteotomy **90** form the predefined osteotomy angle γ . To allow for ease in the implantation of the osteotomy implant **1000** (**1000A**), the osteotomy **90** is further opened by an additional small amount, as shown in FIG. 19B. The impactor assembly **1200** is removed from the osteotomy spreader **1100** and is attached to the osteotome **1100A**. The osteotome **1100A** includes a tubular shaft **1110A** with internal threads **1112A** for threadably engaging the threaded tip **1210** of the shaft **1208** of the impactor assembly **1200**. In some embodiments, the external and internal threads in the osteotome **1100A** and the threaded tip **1210** may be reversed. Alternative, other types of connections can be used, such as bayonet coupling, taper to taper connection, or other quick connect/disconnect couplings.

The osteotome **1100A** includes first and second surfaces **1102A**, **1104A** forming a wedge having a peripheral wall surface **1106A** and a sharp edge **1108A**. The osteotome **1100A** includes a plurality of engraved or otherwise marked lines or gradation markings **1120** on the first surface **1102A** corresponding to additional amount of osteotomy opening. The proximal end portion **1105A** of the first surface **1102A**

14

can be parallel (not inclined relative) to the second surface **1104A**, so that the proximal end portion **1105A** can also serve as a stop for the osteotome **1100A**.

Referring to FIGS. 19A and 20-23, the osteotome **1100A**, coupled to the impactor assembly **1200**, is stacked over the osteotomy spreader **1100** and driven into the osteotomy **90** up to a predetermined gradation marking **1120** to open up the osteotomy by an insertion angle γ' slightly larger than the osteotomy angle γ . The opposite faces **96**, **98** of the osteotomy **90** are secured at the insertion angle γ' using the osteotomy securing device **1300**, as shown in FIG. 22. The osteotomy securing device **1300** can be an adjustable offset tie rod structure that includes first and second members **1310**, **1350**. The first member **1310** includes first and second portions **1302**, **1313** forming an L-shape. A block **1304** extends from the second portion **1313** and has a bone engagement surface **1314**, shown in FIG. 20. One or more holes **1316** extend from an outer surface **1312** of the second portion **1313** to the bone engagement surface **1314** of the block **1304** of the first member **1310** for attaching the first member **1310** to the tibia **80** on a side of the osteotomy **90** adjacent to face **98** with pins or other bone fasteners **1370**, as shown in FIG. 23. The first portion **1302** of the first member **1310** has an elongated cylindrical bore **1320** for adjustably coupling the first member **1310** to the second member **1350**. The osteotomy securing device **1300** can also include an elongated handle **1360** for stabilizing the osteotomy securing device **1300** during attachment to the tibia **80**. In some embodiments, the handle **1360** can be a shaft extending from the first member **1310** of the osteotomy securing device **1300**.

With continued reference to FIGS. 19A and 20-23, the second member **1350** includes first and second portions **1352**, **1353** forming an L-shape. A block **1355** extends from the second portion **1353** and has a bone engagement surface **1354**. One or more holes **1356** extend through the second portion **1353** and the block **1355** of the second member **1350** for attaching the second member **1350** to the tibia **80** on a side of the osteotomy **90** adjacent to face **96** with pins or other bone fasteners **1370**, as shown in FIG. 23. The first portion **1352** of the second member **1350** can be an elongated cylindrical shaft (**1352**) with a flat or planar cutout surface **1351**. The cylindrical shaft **1352** is slidably received into the cylindrical bore **1320** of the first member **1310** and is adjustably coupled to the first member **1310** along an axis D, such that the osteotomy securing device **1300** can span the opened osteotomy **90**, as shown in FIG. 22. The osteotomy securing device **1300** can include a wing nut, set screw or other locking member **1330** for locking and securing the relative position of the first and second member **1310**, **1350** relative to one another to maintain the osteotomy opening at the insertion angle γ' , as shown in FIG. 22. The locking member **1330** can include a portion that threadably passes through the first portion **1302** and through the cylindrical bore **1320** of the first member **1310**, presses against the planar surface **1351** of the cylindrical shaft **1352** and prevents sliding of the cylindrical shaft **1352** relative to the cylindrical bore **1320** when the locking member **1330** is threadably tightened, as shown in FIG. 20.

Referring to FIGS. 22-24, after the implant insertion angle γ' is stabilized with the osteotomy securing device **1300**, as discussed above, the osteotome **1100A** and the osteotomy spreader **1000** can be removed, and the osteotomy implant **1000** (**1000A**) inserted into the osteotomy opening formed by the insertion angle γ' . After full insertion and implantation, the osteotomy securing device **1300** is removed and the first and second faces **96**, **98** of the osteotomy **90** are brought

15

into contact with the osteotomy implant **1000** (**1000A**) at the predetermined osteotomy angle γ (which is smaller than the implant insertion angle γ' , as discussed above).

The osteotomy implant **1000** (**1000A**) and the osteotomy correction can be further secured using the fixation plate/implant **1500**. As discussed above, the fixation plate **1500** can be either patient-specific, i.e., configured during the preoperative plan to have a patient-specific inner surface that mates with a corresponding surface of the patient's tibia after implantation of the osteotomy implant **1000** (**1000A**), or a non-custom fixation plate. In the illustration of FIG. **24**, the fixation plate **1500** includes first and second portions **1502**, **1504** configured in a T-shape and having corresponding fixation holes **1508**, **1506** for bone screws. Another embodiment of a patient-specific fixation plate **400** is discussed above in connection with FIG. **3B** and can be used instead of the fixation plate **1500**.

As discussed above, various patient-specific alignment guides, resection guides, osteotomy guides, osteotomy implants, fixation plates and other osteotomy instruments can be used for correcting a joint misalignment. The various implants and instruments are not limited to the specific configurations and embodiments described above. It is contemplated that the various instruments and implants discussed above can be used interchangeably, such that a surgical kit for a specific patient and specific surgeon can include more than one set of implants and instruments to provide intraoperative choice between different or alternative surgical procedures for the same patient.

The foregoing discussion discloses and describes merely exemplary arrangements of the present teachings. Furthermore, the mixing and matching of features, elements and/or functions between various embodiments is expressly contemplated herein, so that one of ordinary skill in the art would appreciate from this disclosure that features, elements and/or functions of one embodiment may be incorporated into another embodiment as appropriate, unless described otherwise above. Moreover, many modifications may be made to adapt a particular situation or material to the present teachings without departing from the essential scope thereof. One skilled in the art will readily recognize from such discussion, and from the accompanying drawings and claims, that various changes, modifications and variations can be made therein without departing from the spirit and scope of the present teachings as defined in the following claims.

What is claimed is:

1. An osteotomy surgical system comprising:
a patient-specific osteotomy guide having a three-dimensional inner surface as a negative surface of a specific patient's tibia that is configured to closely mate and conform to a corresponding portion of the specific patient's tibia in only one position, wherein the patient-specific osteotomy guide includes a resection slot at a patient-specific position and orientation for guiding a cutting tool to perform an osteotomy according to a preoperative plan for the patient, and a drill support sized and shaped for guiding a drilling of a stress-relief hole at a sharp edge of the osteotomy; and
further comprising a patient-specific osteotomy implant forming a wedge angle equal to a patient-specific osteotomy angle and having patient-specific outer surface.
2. The osteotomy surgical system of claim 1, wherein the osteotomy implant is shaped to form an open channel for a stem implant.

16

3. The osteotomy surgical system of claim 2, wherein the osteotomy implant is U-shaped or horseshoe-shaped.

4. The osteotomy surgical system of claim 3, wherein the osteotomy guide includes a drill hole for guiding the osteotomy implant and intersecting the resection slot and wherein the osteotomy implant includes a protrusion configured to be received into a guiding hole drilled into the tibia through the drill hole.

5. The osteotomy surgical system of claim 1, further comprising a patient-specific fixation plate having a patient-specific inner surface for engaging the tibia and securing the fixation plate.

6. An osteotomy surgical system comprising:

- a patient-specific osteotomy guide having a three-dimensional inner surface as a negative surface of a specific patient's tibia that is configured to closely mate and conform to a corresponding portion of the specific patient's tibia in only one position, wherein the patient-specific osteotomy guide includes a resection slot at a patient-specific position and orientation for guiding a cutting tool to perform an osteotomy according to a preoperative plan for the patient, and a drill support sized and shaped for guiding a drilling of a stress-relief hole at a sharp edge of the osteotomy; and
further comprising a patient-specific osteotomy spreader having first and second surfaces forming a patient-specific osteotomy angle.

7. The osteotomy surgical system of claim 6, further comprising an osteotome having gradation markings for opening the osteotomy to an insertion angle greater than the osteotomy angle.

8. The osteotomy surgical system of claim 7, further comprising an impactor assembly including an impactor plate, a handle, a shaft and a distal tip having threads configured for selective coupling to the osteotomy spreader and the osteotome.

9. The osteotomy surgical system of claim 8, wherein each of the osteotomy spreader and the osteotome includes a threaded tubular portion couplable to the distal tip of the impactor assembly.

10. An osteotomy surgical system comprising:

- a patient-specific osteotomy guide having a three-dimensional inner surface as a negative surface of a specific patient's tibia that is configured to closely mate and conform to a corresponding portion of the specific patient's tibia in only one position, wherein the patient-specific osteotomy guide includes a resection slot at a patient-specific position and orientation for guiding a cutting tool to perform an osteotomy according to a preoperative plan for the patient, and a drill support sized and shaped for guiding a drilling of a stress-relief hole at a sharp edge of the osteotomy; and
further comprising an osteotomy securing device including first and second members configured for securing first and second faces of the osteotomy at an implant insertion angle for inserting the osteotomy implant and wherein the first and second members are slidably adjustable relative to one another.

11. The osteotomy surgical system of claim 10, wherein the first member of the osteotomy securing device includes a cylindrical bore slidably receiving a cylindrical shaft of the second member.

12. The osteotomy surgical system of claim 11, wherein the osteotomy securing device includes a locking member for securing a relative position between the first and second members.

17

13. The osteotomy surgical system of claim 12, wherein the osteotomy securing device includes first and second blocks for removably attaching the first and second members to the tibia at opposite sides of the osteotomy.

14. The osteotomy surgical system of claim 10, further comprising a posterior blade guard having a blade stop portion configured to be inserted against a posterior bone surface of the tibia for protecting soft tissue and a curved retractor portion for retracting soft tissue at an incision site for the osteotomy.

15. An osteotomy surgical system comprising:

a patient-specific osteotomy guide having a three-dimensional inner engagement surface as a negative surface of a specific patient's tibia that is configured to closely mate and conform to a corresponding surface of the specific patient's tibia in only one position, wherein the patient-specific osteotomy guide defines a resection slot at a patient-specific position and orientation for guiding a cutting tool to perform an osteotomy according to a pre-operative plan for the patient;

wherein the resection slot includes two resection slots at patient-specific positions and orientations for guiding the cutting tool to perform osteotomies according to the pre-operative plan for the patient for use with a closed wedge osteotomy.

16. The osteotomy surgical system of claim 15, further comprising a patient-specific fixation plate having a patient-specific inner surface for engaging the tibia and securing the fixation plate.

17. The osteotomy surgical system of claim 15, further comprising a posterior blade guard having a blade stop portion configured to be inserted against a posterior bone surface of the tibia for protecting soft tissue and a curved retractor portion for retracting soft tissue at an incision site for the osteotomy.

18. An osteotomy surgical system comprising:

a patient-specific osteotomy guide having a three-dimensional inner engagement surface as a negative surface of a specific patient's tibia that is configured to closely mate and conform to a corresponding surface of the specific patient's tibia in only one position, wherein the patient-specific osteotomy guide defines a resection slot at a patient-specific position and orientation for guiding a cutting tool to perform an osteotomy according to a pre-operative plan for the patient;

wherein the patient-specific osteotomy guide further includes a drill guide to guide a drill along at least a portion of the resection slot between opposing ends of the slot.

19. The osteotomy surgical system of claim 18, further comprising a patient-specific osteotomy implant forming a wedge angle equal to a patient-specific osteotomy angle and having an elongated protrusion configured to align relative to the drill guide.

20. The osteotomy surgical system of claim 18, further comprising a second drill guide on the patient-specific osteotomy guide including a curved rig configured to guide a drill to form a stress relief hole relative to the osteotomy.

21. An osteotomy surgical system comprising:

a patient-specific osteotomy implant having a three-dimensional patient-specific surface configured to closely mate and conform to a corresponding portion of a specific patient's tibia in only one position,

wherein the patient-specific osteotomy implant is a patient-specific fixation plate having a three-dimensional surface as a negative surface of the specific patient's tibia that is configured to mate with a corre-

18

sponding surface of the specific patient's tibia in only one position relative to an osteotomy formed in the specific patient's tibia; and

further comprising another patient-specific osteotomy implant that forms a wedge angle equal to a patient-specific osteotomy angle and includes another three-dimensional patient-specific surface that is a patient-specific outer boundary surface designed during a pre-operative planning stage as a continuous and smooth surface that provides a continuous contour relative to the contour of the tibia.

22. The osteotomy surgical system of claim 21, further comprising a posterior blade guard having a blade stop portion configured to be inserted against a posterior bone surface of the tibia for protecting soft tissue and a curved retractor portion for retracting soft tissue at an incision site for the osteotomy.

23. An osteotomy surgical system comprising:

a patient-specific osteotomy implant having a three-dimensional patient-specific surface configured to closely mate and conform to a corresponding portion of a specific patient's tibia in only one position,

wherein the patient-specific osteotomy implant is a patient-specific fixation plate having a three-dimensional surface as a negative surface of the specific patient's tibia that is configured to mate with a corresponding surface of the specific patient's tibia in only one position relative to an osteotomy formed in the specific patient's tibia; and

further comprising a patient-specific osteotomy guide having a three-dimensional inner surface configured to closely mate and conform to a corresponding surface of the patient's tibia in only one position and defining a resection slot at a patient-specific position and orientation for guiding a cutting tool to perform an osteotomy according to a pre-operative plan.

24. An osteotomy surgical system comprising:

a patient-specific osteotomy guide having a three-dimensional inner engagement surface as a negative surface of a specific patient's tibia that is configured to closely mate and conform to a corresponding surface of the specific patient's tibia in only one position, wherein the patient-specific osteotomy guide defines a resection slot at a patient-specific position and orientation for guiding a cutting tool to perform an osteotomy according to a pre-operative plan for the patient;

further comprising a patient-specific osteotomy spreader having first and second surfaces forming a patient-specific osteotomy angle.

25. The osteotomy surgical system of claim 24, further comprising an osteotome having gradation markings for opening the osteotomy to an insertion angle greater than the osteotomy angle.

26. The osteotomy surgical system of claim 25, further comprising an impactor assembly including an impactor plate, a handle, a shaft and a distal tip having threads configured for selective coupling to the osteotomy spreader and the osteotome.

27. The osteotomy surgical system of claim 26, wherein each of the osteotomy spreader and the osteotome includes a threaded tubular portion couplable to the distal tip of the impactor assembly.

28. An osteotomy surgical system comprising:

a patient-specific osteotomy implant having a three-dimensional patient-specific surface configured to closely mate and conform to a corresponding portion of a specific patient's tibia in only one position,

wherein the patient-specific osteotomy implant is a patient-specific fixation plate having a three-dimensional surface as a negative surface of the specific patient's tibia that is configured to mate with a corresponding surface of the specific patient's tibia in only one position relative to an osteotomy formed in the specific patient's tibia; and
further comprising a patient-specific osteotomy spreader having first and second surfaces forming a patient-specific osteotomy angle.

29. The osteotomy surgical system of claim **28**, further comprising an osteotome having gradation markings for opening the osteotomy to an insertion angle greater than the osteotomy angle.

30. The osteotomy surgical system of claim **29**, further comprising an impactor assembly including an impactor plate, a handle, a shaft and a distal tip having threads configured for selective coupling to the osteotomy spreader and the osteotome.

31. The osteotomy surgical system of claim **30**, wherein each of the osteotomy spreader and the osteotome includes a threaded tubular portion couplable to the distal tip of the impactor assembly.
